# Synthesis based on cyclohexadienes. Part 24.<sup>1</sup> A new total synthesis of pupukean-2-one and a facile entry to copa and ylanga type sesquiterpene skeletons

# Krishna Kaliappan and G. S. R. Subba Rao\*

Department of Organic Chemistry, Indian Institute of Science, Bangalore-560 012, India

A novel tandem 5-exo-trig allyl and 3-exo-trig radical cyclisation and rearrangement to copa and ylanga type sesquiterpene skeletons from easily prepared cyclohexadienes is reported. A new total synthesis of pupukean-2-one 8, which belongs to a novel class of sesquiterpenes, involving a 5-exo-trig allyl radical cyclisation as the key step is also reported.

In the total synthesis of 5-epi-pupukean-2-one 1 described in the preceding paper, the diene ester 2 was utilised as an equivalent of the substituted 1-methylcyclohexa-1,3-diene 3. Substituted 1-methoxycyclohexa-1,3-dienes 4, readily prepared by the metal—ammonia reduction of the corresponding aromatic ethers followed by a base-catalysed conjugation, afford regiospecific adducts of the type 5 upon cycloaddition with a ketene equivalent. If the bicyclic ketone 5 can be transformed into the bicyclic ketone 6, then the dihydro compound 4 can be used as an equivalent of 1-methylcyclohexa-1,3-diene 3 which essen-

tially involves bridgehead substitution of the methoxy group by a methyl group.

Although this bridgehead substitution methodology has been reported  $^{2,3}$  earlier, its application to the synthesis of natural products has been dismal. We have investigated  $^4$  this reaction which involved the tricyclic compounds having a bridgehead methoxy group that led to the total synthesis of  $(\pm)$ -allo-cedrol (khusiol) 7. In continuation of our interest in the total synthesis of sesquiterpenes,  $^5$  involving the bridgehead substitution strategy, we describe  $^{6,7}$  herein a new total synthesis of pupukean-2-one  $^{8}$  through a  $^{5}$ -exo-trig allyl radical cyclisation and a novel tandem  $^{5}$ -exo-trig allyl and  $^{3}$ -exo-trig radical cyclisation and its rearrangement to copa and ylanga type sesquiterpene skeleton.

#### Results and discussion

The total synthesis of pupukean-2-one **8** was devised using the bridgehead substitution strategy as depicted in Scheme 1.

The retrosynthetic analysis indicated that pupukean-2-one 8 can be obtained from the tricyclic ketone 9 which, in turn, can be prepared from the enone 10 through a bridgehead substitution strategy. The tricyclic ketone 10 can be obtained from the bicyclic ketone 11 having the prenyl group in the *endo* position which, in turn, can be made from the known bicyclic ketone 12.8

### Synthesis of the bicyclic ketone 11

Thus, the bicyclic ketone **12** upon alkylation with LDA and MeI afforded the ketone **13** having the methyl group in the *endo* position (Scheme 2), as evidenced by the spectral data. The <sup>1</sup>H

**Scheme 2** Reagents and conditions: a, LDA, MeI, THF, -78 °C; b, LDA, 3.3-dimethylallyl bromide, THF, HMPA, -78 °C

NMR spectrum of 13 showed a doublet at  $\delta$  1.09 for the *endo* methyl group, a multiplet at  $\delta$  2.73 for the bridgehead proton

and a singlet at  $\delta$  3.52 for the bridgehead methoxy group. The <sup>13</sup>C NMR spectrum of **13** showed only 10 lines which supports the stereoselective nature of the alkylation. Further alkylation with prenyl bromide was achieved by treating the ketone **13** with LDA at -78 °C and quenching the resultant enolate with prenyl bromide in HMPA–THF. The <sup>1</sup>H NMR spectrum of the resulting ketone **11** showed signals at  $\delta$  1.08 (s, Me), 1.59 and 1.73 (both s, allylic Me) and 5.12 (prenyl olefinic H).

The bicyclic ketone 11 having been prepared, the next step was its acid-catalysed rearrangement to generate the tricyclic system. This was achievable through an intramolecular ene cyclisation of the unsaturated ketone 14, obtained from 11, to afford the tricyclic enone 15 (Scheme 3). The resulting tricyclic enone 15 was convertible into pupukean-2-one 8.

With this idea, we attempted a novel one-pot tandem acidcatalysed rearrangement and an intramolecular ene cyclisation of the bicyclic ketone 11: all attempts failed. Thus, treatment of the bicyclic ketone 11 with Lewis acid BF<sub>3</sub>·MeOH, at room temperature gave only recovery of starting material, whilst for reactions at higher temperatures, the product decomposed. Treatment of 11 with SnCl<sub>4</sub>, BF<sub>3</sub>·OEt<sub>2</sub> and HCO<sub>2</sub>H failed to produce the desired compound as did heating it with PTSA in refluxing benzene.

# Stereo- and regio-selective alkylation

Since the acid-catalysed cyclisation of 11 failed to yield the tricyclic skeleton, a radical cyclisation was investigated for the key step to the tricyclic skeleton 15; this was a new strategy involving a 5-exo-trig allyl radical cyclisation. 10

In this approach, the allyl bromide 18 was considered as the key intermediate (Scheme 4), since it can undergo an intra-

molecular 5-exo-trig allyl radical cyclisation to give the isotwistane 17 which can be elaborated to pupukean-2-one 8.

Although allyl radicals have been known for a decade, <sup>10</sup> their cyclisation has been rarely used synthetically, <sup>11,12</sup> since their greater stability makes them less reactive when compared to their saturated and vinylic counterparts. With this in mind, allyl radical cyclisation of the bromide was investigated as a model system.

Since attempted allylic bromination of the ketone 11 with *N*-bromosuccinimide afforded a complex mixture of products, alkylation of the ketone 13 with the dibromide 13 20 was investigated.

Alkylation of the lithium enolate of the ketone 13 at -78 °C with 1,4-dibromo-2-methylbut-2-ene<sup>13</sup> 20, proceeded regio- and stereo-selectively to give, exclusively, the *endo* bromide 19 (Scheme 5), as evidenced from its spectral data. The <sup>1</sup>H NMR

Scheme 5 Reagents and conditions: i, NBS/CCl<sub>4</sub>; ii, LDA, THF, HMPA,  $-78\,^{\circ}\text{C}$ 

spectrum of 19 showed signals at  $\delta$  6.4 (m, olefinic H), 5.73 (t, prenyl olefinic H) and 3.99 (s, CH<sub>2</sub>Br); the mass spectrum showed peaks at 313 (M<sup>+</sup>) and 315 (M<sup>+</sup> + 2) with base peaks at 233 and 110.

The alternative structure 21a for the product was ruled out on the basis of the NMR data, in particular the coupling of the CH<sub>2</sub>Br protons. Further attempted radical cyclisation (see below) of the product gave the ketone 11 as one of the products. If 21a was formed during the alkylation of 13 with 20, the reduced product would have structure 21b whose NMR spectrum would show distinctive signals for the two vinyl methyl groups as a singlet and a doublet. The NMR spectrum of the product was consistent with structure 11 and hence the regioselectivity in the alkylation using the dibromide 20. The reasons for this regioselectivity is not very clear but appears to be due to the steric hindrance from the methyl group which is being examined now.

# A novel radical rearrangement

The allyl bromide 19 having been successfully obtained in good yield, its intramolecular allyl radical cyclisation was investigated (Scheme 6). Radical cyclisation under standard conditions 10 (0.005 M benzene solution of 19 with 1.1 equiv. of TBTH and 0.1 equiv. of AIBN, reflux, 1-2 h) afforded a mixture containing the reduced product 11 (5%) and a new compound 22 (60%) whose IR spectrum showed absorption at 1740 cm<sup>-1</sup>; in its <sup>1</sup>H NMR spectrum signals for olefinic protons at  $\delta$  6.2, 6.4 and 5.1 were absent, but instead there were signals at  $\delta$  4.6 and 4.8 (both d). This clearly suggested that an intramolecular cyclisation has occurred. Since <sup>13</sup>C NMR spectrum of 22 showed a methine carbon at  $\delta$  78.2 the compound is different from the expected 5-exo-trig allyl radical cyclisation product 23. On treatment with PTSA, compound 22 was quantitatively converted into a new isomer 24, whose IR spectrum showed carbonyl absorption at 1740 cm<sup>-1</sup>; moreover, its <sup>1</sup>H NMR spectrum showed no signals for olefinic protons, suggest-

ing that the exo olefin is isomerised into a stable tetrasubstituted olefin. The off-resonance  $^{13}$ C NMR spectrum of **24** showed the presence of four singlets, four doublets, three triplets and four quartets, whereas the expected product **10** should have five singlets, two doublets, four triplets and four quartets. Also, a doublet at  $\delta$  78.53 clearly showed that OMe is attached to a carbon atom bearing a hydrogen.

Scheme 6

These data clearly established the structure of the cyclised and isomerised products as 22 and 24 respectively (Scheme 6) and that the isopropenyl substituent present in 22 was isomerised to the isopropylidene group under acidic conditions to give 24. A probable mechanism for the formation of these compounds 22 and 24 is indicated (Scheme 7). As expected, the

Scheme 7

initial 5-exo-trig allyl radical cyclisation gave the radical 26 which underwent a 3-exo-trig radical cyclisation onto the carbonyl group to give the cyclopropyloxyl radical 27 which further rearranged to 22. Formation of a stable radical adjacent to the methoxy group appeared to be the driving force for this arrangement.

The proposed mechanism was further confirmed by oxidative cleavage of 24 to the diketone 29 (Scheme 8) whose IR spec-

Scheme 8 Reagents and conditions: a, H<sub>2</sub>/Pd-C, EtOH; b, PTS, benzene, heat; c, RuCl<sub>3</sub>, NaIO<sub>4</sub>

trum showed absorption at 1740 cm<sup>-1</sup> (five-membered ring with a keto group) and in whose <sup>1</sup>H spectrum two allylic methyl groups signals were absent. Hydrogenation of **22** afforded a saturated tricyclic ketone **30** in whose <sup>1</sup>H NMR spectrum olefinic protons signals were absent.

A number of natural products possess this skeleton, *e.g.* copacamphor **31**, <sup>14</sup> sinulurene **32** <sup>15</sup> and sativene **33** <sup>16</sup> (Scheme 9)

and their total synthesis by the above strategy may be envisaged. Interestingly, pfaffic acid **34**, <sup>17</sup> a nortriterpene with many biologically interesting properties was found to possess this skeleton as part of the DEF ring system.

# Total synthesis of pupukean-2-one 8

Since the intramolecular 5-exo-trig allyl radical cyclisation of 19 resulted in the tricyclic compound 22, presumably through the isotwistane intermediate 27, because of the stabilisation of the radical at the carbon bearing the methoxy group, it was expected that the radical cyclisation of 18 should result in the desired isotwistane moiety 17.

Thus, the ketone 12 on treatment with PTSA in refluxing benzene, afforded the enone 35, whose structure was deduced from the spectral data. The enone 35 upon treatment with MeLi

in ether afforded the tertiary alcohol 36, whose IR spectrum showed the disappearance of carbonyl group absorption and the appearance at 3300 cm<sup>-1</sup> of hydroxy group absorption. The tertiary alcohol 36 upon treatment with a catalytic amount of perchloric acid afforded the bicyclic ketone 37, whose structure was deduced from the spectral data and was comparable to that reported. 18 The IR spectrum of 37 showed strong absorption at 1720 cm<sup>-1</sup> (saturated ketone) whilst its <sup>1</sup>H NMR spectrum showed signals at  $\delta$  1.22 (s, bridgehead Me) and 2.94 (bridgehead H) but no methoxy group signal at  $\delta$  3.5. The <sup>13</sup>C NMR spectrum of 37 showed a quartet, three triplets, three doublets and two singlets confirming the above structure. The mass spectrum showed its base peak at 94 due to the diene formed by the loss of a ketene due to retro Diels-Alder fragmentation. Alkylation of the lithium enolate generated from the bicyclic ketone 37, with methyl iodide afforded exclusively the ketone 38 having an endo methyl group (Scheme 10); its <sup>1</sup>H NMR spectrum

Scheme 10 Reagents and conditions: a, PTS, benzene, heat; b, MeLi, Ether, 0 °C; c, HClO<sub>4</sub>, CH<sub>2</sub>Cl<sub>2</sub>; d, LDA, MeI, THF, -78 °C; e, LDA, BrCH<sub>2</sub>C(Me)=CHCH<sub>2</sub>Br, THF, HMPA, -78 °C

showed only one doublet at  $\delta$  1.02 (*endo*-Me) whilst its mass spectrum showed a base peak at 94 due to the retro Diels–Alder fragment and a molecular ion peak at 150. Further alkylation of the ketone **38** with 1,4-dibromo-2-methylbut-2-ene **21** gave the bicyclic allyl bromide **18** having a five-carbon substituent in the *endo* position; its  $^1$ H NMR spectrum showed signals at  $\delta$  5.8 (prenyl olefinic H), 3.98 (s, CH<sub>2</sub>Br) and 1.73, 1.21 and 1.05 (all s, Me). The mass spectrum of **18** showed a very weak molecular ion peak at 297 (M<sup>+</sup>), a strong peak at 217 (M – Br) and a base peak at 94 for the retro Diels–Alder fragment.

Intramolecular radical cyclisation of **18** under standard conditions afforded the *5-exo-trig* allyl radical cyclised product **17**, as the major product (Scheme 11). The structure of **17** was

deduced from its spectral data: its <sup>1</sup>H NMR spectrum showed the absence of signals at  $\delta$  6.4, 6.3 and 5.8 (olefinic H) whilst those at  $\delta$  4.6 and 4.8 (both s, exocyclic olefinic H) confirmed its structure. The mass spectrum of 17 showed its molecular ion peak at 218 as the base peak. The structure of 17 was further confirmed by its isomerisation to the tricyclic ketone 9 with PTSA in refluxing benzene. The <sup>1</sup>H NMR spectrum of 9 showed the absence of the olefinic proton signals which suggested that the double bond had isomerised to a tetrasubstituted situation; there were signals at  $\delta$  2.9 (bridgehead H), 1.61 and 1.51 (both s, allylic Me) and 1.14 and 0.89 (bridgehead Me). The mass spectrum of 9 showed its molecular ion peak at 218 which is also the base peak. Hydrogenation of the ketone with Pt-C in MeOH afforded a mixture (4:1) containing pupukean-2-one 8 as the major product whose spectral data are in accordance with that reported.19

In conclusion, an efficient method for the construction of the copa and ylanga type sesquiterpene skeleton is reported. This methodology is fairly flexible and can be extended for the total synthesis of pfaffic acid, a highly biologically active nortriterpene. A new total synthesis of pupukean-2-one 8, which belongs to a novel class of sesquiterpenes, involving a 5-exo-trig-allyl radical cyclisation as the key step is also reported.

# Experimental 20

### 1-Methoxy-3-endo-methylbicyclo[2.2.2]oct-5-en-2-one 13

A 1 mol dm<sup>-3</sup> solution of BuLi in hexane (21.7 cm<sup>3</sup>, 21.7 mmol) was added to diisopropylamine (2.9 cm<sup>3</sup>, 22 mmol) in THF (30 cm $^3$ ) at -78 °C under argon. The resultant solution of lithium diisopropylamide was stirred at −78 °C for 1 h after which a solution of the ketone 12 (3 g, 19.7 mmol) in dry THF (40 cm<sup>3</sup>) was added dropwise to it. The resultant lithium enolate was stirred at -78 °C for 1 h after which a solution of MeI (2.5 cm<sup>3</sup>, 40 mmol) in THF was added at once. After being stirred for 1 h, the reaction mixture was poured onto saturated aqueous NH<sub>4</sub>Cl and extracted with ether  $(3 \times 50 \text{ cm}^3)$ . The combined extracts were washed successively with water, aq. sodium thiosulfate, water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated. Purification of the residue using column chromatography [ethyl acetate-light petroleum (1:9)] afforded the product 13 as a colourless liquid (2.9 g, 90%);  $v_{\text{max}}/\text{cm}^{-1}$  2930, 1715 and 1640;  $\delta_{\rm H}$  1.09 (3H, d, J 7.2, CHMe), 1.6–2.2 (5H, m), 2.73 (1H, m, bridgehead H), 3.52 (3H, s, OMe) and 6.1-6.5 (2H, m, olefinic H);  $\delta_{\rm C}$  16.75 (q), 24.43 (t), 24.98 (t), 37.56 (d), 43.41 (d), 52.26 (q), 83.6 (s), 129 (d), 134.19 (d) and 210.34 (s); m/z 166 (M<sup>+</sup>, 55%), 138 (100), 122 (100) and 110 (100) (Found:  $M^+$ , 166.0986.  $C_{10}H_{14}O_2$  requires M, 166.0994).

# 1-Methoxy-3-methyl-3-endo-(3-methyl-2-but-2-enyl)bicyclo-[2.2.2]oct-5-en-2-one 11

To a freshly prepared LDA solution [prepared from a 1 M solution of BuLi (8.6 cm<sup>3</sup>, 8.6 mmol) and diisopropylamine  $(1.2 \text{ cm}^3, 9.4 \text{ mmol})$  in THF  $(20 \text{ cm}^3)$ ] at  $-78 \,^{\circ}\text{C}$  under argon, was added dropwise a solution of the ketone 13 (1.3 g, 7.8 mmol) in THF (30 cm<sup>3</sup>). The resultant solution was stirred for 1 h at the same temperature after which it was quenched with a solution of prenyl bromide (1.7 cm<sup>3</sup>, 15 mmol) in THF and then treated with HMPA (2.8 cm<sup>3</sup>, 15 mmol). The reaction mixture was stirred overnight and then poured onto 2 м aq. HCl (100 cm<sup>3</sup>). Work-up followed by column chromatography [ethyl acetate-light petroleum (1:9)] afforded compound 11 as a colourless oil (1.35 g, 80%);  $v_{\text{max}}/\text{cm}^{-1}$  3020, 2940, 1720 and 1640;  $\delta_{\rm H}$  0.85–2.18 (6H, m), 1.08 (3H, s, Me), 1.59 (3H, s, Me), 1.73 (3H, s, Me), 2.61 (1H, m, bridgehead H), 3.52 (3H, s, OMe), 5.12 (1H, t, J 7.1 Hz, olefinic H), 6.17 (1H, dd, J 6.7 and 1.7, olefinic H) and 6.45 (1H, dd, J 8.2) and 6.7);  $\delta_{\rm C}$  17.6 (q), 21.0 (q), 21.1 (q), 25.7 (t), 26.2 (t), 36.5

(t), 39.5 (d), 47.0 (s), 52.8 (q), 84.2 (s), 118.7 (d), 127.4 (d), 134.6 (s), 136.5 (d) and 213.1 (s); m/z 234 (M<sup>+</sup>, 90%), 206 (25), 175 (26), 150 (75), 136 (100) and 110 (100) (Found: M<sup>+</sup>, 234.1616.  $C_{15}H_{22}O_2$  requires M, 234.1620).

### 1,4-Dibromo-2-methylbut-2-ene 20

To a stirred solution of isoprene (6.8 g) in dry chloroform (100 cm³) under a  $N_2$  atmosphere in the dark, was added  $Br_2$  (16 g) dropwise at room temperature. After being stirred for 12 h, the reaction mixture was evaporated *in vacuo* and the residue was distilled under reduced pressure (bp 60 °C/10 mmHg) to afford the dibromide **20** as a colourless oil (10 g);  $\delta_H$  1.85 (3H, s, Me), 3.93 [2H, s,  $H_2$ CC(Me)=], 3.95 (2H, d, J 7.2,  $H_2$ CCH=) and 5.92 (1H, t, J 8.1, olefinic H).

# 3-endo-4-Bromo-3-methylbut-2-enyl)-1-methoxy-3-methylbicyclo[2.2.2]oct-5-en-2-one 19

To a freshly prepared LDA solution [prepared from 1 mol dm<sup>-3</sup> solution of BuLi (3.5 cm<sup>3</sup>, 3.5 mmol) and diisopropylamine (0.5 cm<sup>3</sup>, 3.5 mmol) in THF (10 cm<sup>3</sup>)] at -78 °C under argon, was added dropwise a solution of the ketone 13 (1 g, 3.19 mmol) in THF (20 cm<sup>3</sup>). The resultant solution was stirred for 1 h at the same temperature and then quenched with a solution of 1,4dibromo-2-methylbut-2-ene 21 (1.5 g, 15 mmol) in THF and then treated with HMPA (1.2 cm<sup>3</sup>, 6.5 mmol). The reaction mixture was stirred overnight and poured onto 2 m aq. HCl (100 cm<sup>3</sup>). Work-up followed by column chromatography [ethyl acetate-light petroleum (1:9)] afforded the bromo ketone 19 as a colourless oil (1.3 g, 70%);  $v_{\text{max}}/\text{cm}^{-1}$  3010, 2920, 1720 and 1640;  $\delta_{\text{H}}$  1.12 (3H, s, Me), 1.2–2.36 (6H, m), 1.76 (3H, s, Me), 2.62 (1H, m, bridgehead H), 3.52 (3H, s, OMe), 3.99 (2H, s, CH<sub>2</sub>Br), 5.73 (1H, t, J 6.8, olefinic), 6.21 (1H, dd, J 6.4 and 1.8, olefinic H) and 6.51 (1H, dd, J 8.1 and 6.4, olefinic H);  $\delta_{\rm C}$  14.6, 21.7, 21.8, 26.4, 36.8, 39.9, 40.8, 46.9, 52.7, 84.1, 125.5, 127.6, 134.4, 136.4 and 212.4; m/z 315 (M + 2, 5%), 313 (M<sup>+</sup>, 5), 233 (30), 205 (70), 137 (100) and 110 (100) [Found:  $M^+$  – Br, 233.1523.  $C_{15}H_{21}O_2(M - Br)$  requires M, 233.1540].

# 5-Methoxy-8-methyl-10-(prop-2-enyl)tricyclo[ $4.4.0.0^{2.8}$ ]decan-7-one 22

A solution of TBTH (1.1 cm<sup>3</sup>, 3.6 mmol) and AIBN (20 mg) in dry benzene (5 cm<sup>3</sup>) was added dropwise to a degassed benzene solution (0.005 mol dm<sup>-3</sup>) of the bromide 19 (1 g, 3.2 mmol) under a nitrogen atmosphere. After being refluxed for 3 h, the reaction mixture was concentrated in vacuo and the residue was taken up in ether and the solution washed with 1% aq. NH<sub>4</sub>OH, water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated. Column chromatography (ethyl acetate-hexane, 1:19) of the residue initially afforded the ketone 11 (38 mg, 5%) and then, with the same eluent, the tricyclic ketone 22 (510 mg, 69%) as a colourless oil;  $v_{\text{max}}/\text{cm}^{-1}$  3020, 2920, 1740 and 1620;  $\delta_H$  1.0 (3H, s, Me), 1.67 (3H, br, =C-CH<sub>3</sub>), 1.1-1.98 (9H, m), 2.4 (1H, m), 3.2 and 3.31 (3H, s, OMe), 3.4 (1H, m, CHOMe), 4.6 and 4.67 (1H, d, J 1.1, olefinic), 4.70 and 4.78 (1H, d, J 1.1);  $\delta_{\rm C}$ (for the major isomer): 9.77, 20.05, 21.26, 24.91, 39.17, 44.15, 46.3, 46.35, 53.6, 54.1, 54.5, 78.2, 107.17, 145.97 and 216.51; m/z 234 (20%), 203 (30), 175 (60), 134 (50), 110 (100), 91 (70) and 41 (72) (Found: M+, 234.1618.  $C_{15}H_{22}O_2$  requires M, 234.1620).

# 10-Isopropylidene-5-methoxy-8-methyltricyclo $[4.4.0.0^{2.8}]$ decan-7-one 24

A solution of the ketone **22** (200 mg, 0.8 mmol) and PTSA (catalytic) in dry benzene ( $10 \text{ cm}^3$ ) was refluxed for 45 min. The reaction mixture was cooled, washed with saturated aq. NaHCO<sub>3</sub> ( $2 \times 5 \text{ cm}^3$ ) and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated under reduced pressure. The residue was purified on a silica gel column [ethyl acetate–hexane (1:19)] to furnish the tricyclic olefin **24** (95%, 190 mg) which was recrystallised from

hexane to give a colourless crystalline solid; mp 98 °C;  $\nu_{\rm max}/{\rm cm}^{-1}$  3040, 2930, 1740 and 1620;  $\delta_{\rm H}$  1.09 (3H, s, Me), 1.5 (3H, s, Me), 1.65 (3H, s, Me), 1.7–2.2 (7H, m), 2.42 (1H, br), 2.68 (1H, d, J 1.6), 3.35 (3H, s, OMe) and 3.42 (1H, m, CHOMe);  $\delta_{\rm C}$  10.48 (q), 19.7 (q), 19.72 (q), 20.93 (t), 25.24 (t), 41.28 (t), 48.02 (d), 49.68 (d), 53.21 (d), 54.9 (s), 55.43 (q), 78.53 (d), 121.76 (s), 130.72 (s) and 218.17 (s); m/z 234 (M<sup>+</sup>, 30%), 159 (50), 134 (80) and 101 (100) (Found: M<sup>+</sup>, 234.1624.  $C_{15}H_{22}O_2$  requires M, 234.1620).

# 10-Isopropyl-5-methoxy-8-methyltricyclo[4.4.0.0<sup>2,8</sup>]decan-7-one 30

A suspension of the tricyclic olefin **22** (100 mg, 0.42 mmol) and 10% Pd–C (20 mg) in dry EtOAc (5 cm³) was magnetically stirred under a H<sub>2</sub> atmosphere (1 atm) for 12 h. The reaction mixture was filtered through a pad of Celite and the solvent was removed under reduced pressure to furnish the ketone **30** as an amorphous viscous liquid (90 mg, 90%);  $v_{\rm max}/c$  cm<sup>-1</sup> 2920 and 1740;  $\delta_{\rm H}$  0.73 (3H, d, J 6.4, CHMe), 0.85 (3H, d, J 6.4, CHMe), 0.93 (3H, s, Me), 0.9–1.9 (10H, m), 2.27 (1H, m), 3.26 (3H, s, OMe) and 3.34 (1H, m, CHOMe);  $\delta_{\rm C}$  10.3, 19.6, 19.7, 20.6, 21.1, 25.3, 31.6, 40, 45.9, 46.5, 46.8, 54.9, 55.3, 78.6 and 218.6; m/z 236 (15%), 204 (17), 174 (50) and 133 (100) (Found: M<sup>+</sup>, 236.1758.  $C_{15}H_{24}O_2$  requires M, 236.1776).

### 5-Methoxy-8-methyltricyclo[4.4.0.0.<sup>2,8</sup>]decane-7,10-dione 29

To a vigorously stirred mixture of the olefin **24** (100 mg, 0.42 mmol), carbon tetrachloride (1 cm³), acetonitrile (1 cm³), water (1.5 cm³) and sodium metaperiodate (375 mg, 1.68 mmol) was added ruthenium trichloride trihydrate (3 mg). After continued stirring for 6 h the mixture was diluted with CH<sub>2</sub>Cl<sub>2</sub> (25 cm³). The organic layer was separated and washed successively with water and brine and then dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated. The crude product was chromatographed (ethyl acetate–hexane, 1:9) to afford the diketone **29** as a gummy residue (53 mg, 60%);  $v_{\text{max}}/\text{cm}^{-1}$  2920 and 1742;  $\delta_{\text{H}}$  1.22 (3H, s, Me), 1.1–2.72 (9H, m), 3.38 (3H, s, OMe) and 3.48 (1H, m, CHOMe); m/z 208 (M<sup>+</sup>, 28%), 148 (35) and 128 (100) (Found: M<sup>+</sup>, 208.1097. C<sub>12</sub>H<sub>16</sub>O<sub>3</sub> requires M, 208.1099).

### 1-Methoxybicyclo[3.2.1]oct-3-en-2-one 35

A mixture of the ketone **12** (3.5 g, 23 mmol) and PTSA (4 g) in dry benzene was refluxed under a nitrogen atmosphere for 2 h after which it was diluted with benzene and washed with water, saturated aq. sodium hydrogen carbonate and brine and then dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated. Chromatography of the residue on silica gel using ethyl acetate–hexane (1:7) as eluent gave the methoxy enone **35** as a viscous liquid (2.8 g, 60%);  $v_{\text{max}}/\text{cm}^{-1}$  3010, 2930, 1670 and 1620;  $\delta_{\text{H}}$  1.3–2.3 (6H, m), 3.05 (1H, m, bridgehead H), 3.42 (3H, s, OMe), 5.96 (1H, d, *J* 9.7, olefinic H) and 7.31 (1H, dd, *J* 9.7 and 6.8, olefinic H);  $\delta_{\text{C}}$  27.2 (t), 29.4 (t), 37.7 (d), 42.6 (t), 53.2 (q), 89.3 (s), 127.07 (d), 155.9 (d) and 200.5 (s); m/z (M<sup>+</sup> 152, 80%), 123 (100) and 81 (50) (Found: M<sup>+</sup>, 152.0851. C<sub>9</sub>H<sub>12</sub>O<sub>2</sub> requires M, 152.0837).

# 1-Methoxy-2-methylbicyclo[3.2.1]oct-3-en-2-ol 36

To a solution of the enone **35** (2.4 g, 15.7 mmol) in dry ether at 0 °C was added methyllithium (1 mol dm<sup>-3</sup> solution in ether; 20 cm<sup>3</sup>) and the mixture stirred at 0 °C for 2 h. Excess of methyllithium was quenched by addition of saturated aq. ammonium chloride. Work-up afforded the alcohol **36** as a colourless liquid (2.2 g, 83%);  $v_{\rm max}$  cm<sup>-1</sup> 3300–2930;  $\delta_{\rm H}$  1.15–2.5 (7H, m), 1.3 (3H, s, Me), 3.35 (3H, s, OMe), 5.29 (1H, d, J 9.4, olefinic H), 5.6 (1H, dd, J 9.4 and 5.2, olefinic H).

# 1-Methylbicyclo[2.2.2]oct-5-en-2-one 37

A mixture of the alcohol 36 (12 g, 11.9 mmol), CH<sub>2</sub>Cl<sub>2</sub> (50 cm<sup>3</sup>) and HClO<sub>4</sub> (70% aqueous; 3 drops) was stirred at room tem-

perature for 30 min after which it was diluted with CH<sub>2</sub>Cl<sub>2</sub>, washed with water, aq. sodium hydrogen carbonate and brine and then dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated. Chromatography of the crude product over silica gel [ether-pentane (1:49) as eluent] yielded the ketone 37 as a viscous liquid (1.3 g, 82%);  $v_{\rm max}/{\rm cm}^{-1}$  3010, 2925, 1720 and 1630;  $\delta_{\rm H}$  1.22 (3H, s), 1.2–2.22 (4H, m), 2.05 (2H, d, J, CH<sub>2</sub>CO), 2.95 (1H, m, bridgehead H), 5.67 (1H, d, J 8.2 and 1.6, olefinic H) and 6.47 (1H, dd, J 8.2 and 6.6, olefinic H);  $\delta_{\rm C}$  17.3 (q), 25.6 (t), 29.8 (t), 31.8 (d), 40.0 (t), 48.5 (s), 133.3 (d), 136.6 (d) and 212.6 (s); m/z 136 (M<sup>+</sup>, 10%) and 94 (100) (Found:  $M^+$ , 136.0890.  $C_9H_{12}O$  requires M, 136.0888).

#### 1,3-Dimethylbicyclo[2.2.2]oct-5-en-2-one 38

To a freshly prepared LDA solution [prepared from 1 mol dm<sup>-3</sup> solution of BuLi (7.2 cm<sup>3</sup>, 7.2 mmol) and diisopropylamine (1 cm<sup>3</sup>, 7.9 mmol) in THF (20 cm<sup>3</sup>)] at -78 °C under argon, was added dropwise a solution of the ketone 37 (19, 6.57 mmol) in THF (20 cm<sup>3</sup>). After being stirred at -78 °C for 1 h, the reaction mixture was treated with methyl iodide (1 cm<sup>3</sup>, 15 mmol) in THF (5 cm<sup>3</sup>) and stirring continued for a further 1 h. After this, the reaction mixture was poured onto saturated aq. ammonium chloride and extracted with ether. The extract was washed successively with water, aq. sodium thiosulfate solution, water and brine and then dried (Na2SO4) and evaporated. Chromatography of the crude product on silica gel [ether-pentane (1:49)] afforded the ketone **38** (0.9 g, 80%);  $v_{\text{max}}/\text{cm}^{-1}$  3005, 2925, 1720 and 1620;  $\delta_{\rm H}$  1.02 (3H, d, J 7.4, CHCH<sub>3</sub>), 1.16 (3H, s, me), 1.1-1.9 (5H, m), 2.66 (1H, m, bridgehead H), 5.71 (1H, d, 1/2ABq, J 8.2 and 0.8, olefinic) and 6.31 (1H, dd, 1/2Abq, J 8.2 and 6.6, olefinic);  $\delta_C$  17.2 (2 × q), 26 (t), 29.3 (t); 38.7 (d), 43.9 (s), 48.3 (d), 123.1 (d), 135.4 (d) and 214.4 (s); m/z 150 (M<sup>+</sup>, 8%), 134 (15), 94 (100) and 79 (60) (Found: M<sup>+</sup>, 150.1031.  $C_{10}H_{14}O$  requires M, 150.1045).

#### 3-endo-(4-Bromo-3-methylbut-2-enyl)-1,3-dimethylbicyclo-[2.2.2]oct-5-en-2-one 18

To a freshly prepared LDA solution [prepared from 1 mol dm<sup>-3</sup> solution of BuLi (2.2 cm<sup>3</sup>, 2.2 mmol) and diisopropylamine (2.4 cm<sup>3</sup>, 2.9 mmol) in THF (10 cm<sup>3</sup>)] at -78 °C under argon was added dropwise the ketone 38 (600 mg, 2 mmol). The reaction mixture after being stirred at -78 °C for 1 h, was treated with 1,4-dibromo-2-methylbut-2-ene 21 (1 cm<sup>3</sup>) and then immediately with HMPA (1 cm<sup>3</sup>). The reaction mixture was stirred overnight and then poured onto 2 m aq. HCl. Work-up followed by chromatography of the crude product over silica gel [ethyl acetate-hexane (1:19)] afforded the bromide 18 as a liquid (820 mg, 70%);  $v_{\text{max}}/\text{cm}^{-1}$  3010, 2920 and 1720;  $\delta_{\text{H}}$  1.02 (3H, s, Me), 1.17 (3H, s, Me), 1.1-2.2 (9H, m), 2.59 (1H, m, bridgehead H), 3.95 (2H, m, CH<sub>2</sub>Br), 5.62 (1H, t, J 8.1, olefinic H), 5.78 (1H, dd, J 8.4 and 1.2, olefinic H) and 6.46 (1H, dd, J 8.4 and 6, olefinic H);  $\delta_{\rm C}$  14.93, 17.74, 18.02, 21.54, 22.22, 26.45, 29.8, 30.09, 37.45, 40.86, 126.88, 131.95, 135.89, 137.82 and 216.66; m/z 299 (M<sup>+</sup> + 2, 2%), 297 (M<sup>+</sup>, 1), 217 (90), 121 (60), 94 (100) and 79 (100) (Found: M+, 297.0839. C<sub>15</sub>H<sub>21</sub>OBr requires M, 297.0854).

### 1,3-Dimethyl-5-(prop-2-enyl)tricyclo[4.3.1.0<sup>3,7</sup>]decan-2-one 17

A solution of TBTH (0.7 cm<sup>3</sup>, 2.2 mmol) and AIBN (20 mg) in dry benzene (5 cm<sup>3</sup>) was added dropwise to a degassed benzene solution (0.005 mol dm<sup>-3</sup>) of the bromide 18 (600 mg, 2.0 mmol) under a nitrogen atmosphere. After being refluxed for 3 h, the reaction mixture was concentrated under reduced pressure, and the residue was taken up in ether and the solution washed with 1% aq. NH<sub>4</sub>OH, water, brine and then dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated. Column chromatography (ethyl acetate-hexane, 1:19) afforded the tricyclic ketone 17 as a colourless oil (240 mg, 60%);  $v_{\text{max}}/\text{cm}^{-1}$  3020, 2930 and 1720;  $\delta_{\rm H}$  0.83 and 0.88 (3H, s, Me), 1.11 and 1.16 (3H, s, Me), 0.9–2.3 (14H, m), 4.5 and 4.63 (1H, d, J 1.2, olefinic H),

4.69 and 4.73 (1H, d, J 1.2, olefinic H); m/z 218 (M<sup>+</sup>, 100%) and 93 (60) (Found: M<sup>+</sup>, 218.1675. C<sub>15</sub>H<sub>22</sub>O requires M, 218.1671).

### 1,3-Dimethyl-5-isopropylidenetricyclo[4.3.1.0<sup>3,7</sup>]decan-2-one 9

A solution of the ketone 17 (80 mg, 0.8 mmol) and PTSA (catalytic) in dry benzene (5 cm<sup>3</sup>) was refluxed for 45 min after which it was cooled, washed with saturated aq. NaHCO<sub>3</sub> (2 × 5 cm<sup>3</sup>) and brine and then dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated under reduced pressure. The residue was purified over a silica gel column [ethyl acetate-hexane (1:19)] to furnish the tricyclic olefin 9 (70 mg, 90%) which was recrystallised from hexane;  $v_{\text{max}}/\text{cm}^{-1}$ 2920 and 1712;  $\delta_{\rm H}$  0.89 (3H, s, Me), 1.17 (3H, s, Me), 0.9–2.4 (9H, m), 1.52 (3H, s, Me), 1.62 (3H, s, Me) and 2.9 (1H, m, 6-H); m/z 218 (M<sup>+</sup>, 100%), 162 (50) and 134 (80) (Found: M<sup>+</sup>, 218.1681.  $C_{15}H_{22}O$  requires M, 218.1671).

### Pupukean-2-one 8

A suspension of the tricyclic olefin 9 (60 mg, 0.3 mmol) and 10% Pt-C (20 mg) in dry MeOH (5 cm<sup>3</sup>) was magnetically stirred under a H<sub>2</sub> atmosphere for 12 h after which it was filtered through a Celite pad and once again stirred for 12 h under hydrogen after addition of a further catalytic amount of Pt-C. After this, the reaction mixture was filtered through a pad of Celite and evaporated under reduced pressure to furnish an inseparable mixture of the ketone 8 (50 mg) and the isomeric ketone 43 in the ratio (4:1);  $v_{\rm max}/{\rm cm}^{-1}$  1710;  $\delta_{\rm H}$  0.83 and 0.85  $(6H, 2d, 2 \times CH_3CH), 0.92 (3H, s, Me), 1.13 (3H, s, Me), 1.3-$ 1.8 (11H, m) and 2.32 (1H, m); m/z 220 (M<sup>+</sup>, 30%), 159 (80) and 93 (100) (Found: M<sup>+</sup>, 220.1830. Calc. for C<sub>15</sub>H<sub>24</sub>O: M, 220.1828).

### Acknowledgements

We thank Professor N. C. Chang of National Sun Yat-Sen University, Kaohsiung, Taiwan, for kindly providing the spectra of 8. We thank the CSIR, New Delhi, for the award of a fellowship to K. K.
