

# A DEFINITE INTEGRAL

BY S. CHOWLA

(Government College, Lahore)

Received March 6, 1939

THEOREM: If  $n$  and  $r$  are non-negative integers,  
where  $r < n$ , then

$$(r+1) K(r) = (-1)^{n-1} (n-r) K(n-r-1)$$

where

$$K(r) = \int_0^1 \frac{1}{u} (\log u)^r \left\{ \log \left( \frac{1+u}{1-u} \right) \right\}^{n-r} du$$

Proof: Integration by parts, gives

$$\begin{aligned} K(r) &= - \int_0^1 \log u \left( \log \frac{1+u}{1-u} \right)^{n-r} \frac{r (\log u)^{r-1}}{u} du \\ &\quad - \int_0^1 (\log u) (\log u)^r \left( \log \frac{1+u}{1-u} \right)^{n-r-1} (n-r) \left( \frac{1-u}{1+u} \right) \frac{2}{(1-u)^2} du \\ &= -r K(r) - 2(n-r) \int_1^0 \left( \log \frac{1-x}{1+x} \right)^{r+1} \left( \log \frac{1}{x} \right)^{n-r-1} \frac{(1+x)^2}{4x} \left( \frac{-2}{(1+x)^2} \right) dx \end{aligned}$$

by means of the substitution  $u = \frac{1-x}{1+x}$ .

Hence

$$K(r) = -r K(r) - (-1)^n (n-r) K(n-r-1)$$

Corollary. If  $n$  is an even positive integer, then

$$\int_0^1 \frac{1}{u} \left[ \left\{ \log u + \log \frac{1+u}{1-u} \right\}^n - (\log u)^n \right] du = 0$$

(See *American Mathematical Monthly*, November 1938.)

*Correction to a previous paper.* My paper "A remark on  $g(n)$ " in these *Proceedings* for January 1939 contains some trivial blunders, but the whole argument is rendered correct by replacing " $\epsilon = \frac{1}{100}$ " by " $\epsilon = \frac{1}{200}$ ". When this change is made the argument reads correctly.
