Key indicators

Single-crystal X-ray study
T = 291 K

Mean m(C-C) = 0.01 Å

R factor = 0.019
wrR factor = 0.186
Data-to-parameter ratio = 14.4

For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org

N-Phenylethyl-N'-[3-(trifluoromethyl)phenyl]thiourea

The title compound, C_{14}H_{18}F_{3}N_{2}S, is a biologically active anti-implantation agent. The dihedral angle between the phenyl and trifluoromethylphenyl rings is 15.9 (2)°. The crystal structure is stabilized by intermolecular N-H···S hydrogen bonds, forming dimers.

Comment

The design and synthesis of anti-fertility drugs leading to the inhibition of implantation has attracted considerable interest in the last few years. The title compound, (I), exhibits anti-implantation activity, and has been tested for uterotrophic and oestrogenic activity in rats (Nagarajan et al., 1984).

The molecular structure and a packing diagram for (I) are shown in Figs. 1 and 2, respectively. Atom C7 deviates from the plane of the attached aromatic ring by 0.035 (96) Å. The torsion angles C1-N2-C8-N3, N2-C8-N3-C9, C8-N3-C9-C10 and N3-C9-C10-C11 are 6.33 (66), 178.4 (4), -169.54 (40) and -64.64 (52)°, respectively. The bond lengths C8-N2, C8-N3, C1-N2 and C9-N3 are 1.353 (6), 1.324 (6), 1.415 (6) and 1.456 (6) Å, respectively, indicating that the electronic environments around these N atoms are different.

The crystal structure is stabilized by intermolecular N-H···S hydrogen bonds, forming dimers in the solid state. It is interesting that atom H3n does not participate in any hydrogen-bond formation. The approach of a neighbouring molecule is hindered because of the bulky aromatic groups which flank this N atom, thus eliminating formation of a possible hydrogen bond (Fig. 2).

Experimental

The title compound was synthesized according to the literature procedure of Nagarajan et al. (1984), and crystals of (I) were obtained from a solution in a mixture of dichloromethane and carbon tetrachloride, by slow evaporation at 278 K.
The amino H atoms were located in a difference Fourier map and refined isotropically. The methylene and aromatic H atoms were constrained to ride on their parent atoms, with $C-H = 0.93-0.97 \AA$ and $U_{iso}(H) = 1.2U_{eq}(C)$. The phenyl ring exhibits probable disorder, as is indicated in the large displacement ellipsoids, but this does not in any way affect the nature of intermolecular interactions and also the molecular geometry and hence has not been dealt with.

Data collection: SMART (Bruker, 2000); cell refinement: SMART; data reduction: SAINT (Bruker, 2000); program(s) used to solve structure: SIR92 (Altomare et al., 1993); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: ORTEP-3 for Windows (Farrugia, 1997) and CAMERON (Watkin et al., 1996); software used to prepare material for publication: PLATON (Spek, 2003).

The authors thank the Department of Science and Technology, India, for data collection on the CCD facility set up under the IRFA-DST programme, and the CSIR, India, for a Junior Research Fellowship to DC.
