# 1-(4-Chlorobenzyl)-6,6-dimethyl-2-phenyl-1,5,6,7tetrahydro-4*H*-indol-4-one

In the title compound,  $C_{23}H_{22}CINO$ , there are two independent molecules showing similar conformations, the tetrahydroindole ring system being approximately planar except for the dimethyl-substituted C atom. Molecules are linked *via*  $C-H\cdots O$ ,  $C-H\cdots \pi$  and  $C-H\cdots Cl$  interactions, forming a sheet-like structure.

Received 4 August 2005 Accepted 24 August 2005, Online 31 August 2005

## Comment

The previous paper (Chopra *et al.*, 2005) describes the background to this study. Unlike the compound reported in that paper, the presence of chlorine in the title compound, (I), generates C-H. Cl interactions contributing to a change in the packing mode.

In compound (I), there are two independent molecules (A and B) in the asymmetric unit (Fig. 1). In the tetrahydroindole ring system in molecule A, atom C5 deviates by 0.621 (4) Å from the C6-C8/C3/C4 mean plane, whereas in molecule B, atom C28 deviates 0.601 (4) Å from the C29-C31/C26/C27 mean plane. Cremer & Pople (1975) analysis for the sixmembered ring of molecule A reveals the puckering parameters as Q(2) = 0.350 (4) Å,  $\varphi(2) = 116.1 (8)^{\circ}$ , Q(3) =0.273 (5) Å, Q = 0.444 (5) Å and  $\theta = 52.1$  (5)°, and in molecule B these values are Q(2) = 0.341 (4) Å,  $\varphi(2) = 118.3$  (7)°. Q(3)= 0.265 (4) Å, Q = 0.431 (5) Å and  $\theta = 52.1$  (5)°. The conformation of molecule B is stabilized by an intramolecular C- $H \cdots \pi$  interaction (Fig. 1 and Table 2). A C-H \cdots O intermolecular hydrogen bond involving H9A holds the two molecules in the asymmetric unit together. Intermolecular C-H $\cdots$   $\pi$  interactions involving atoms H4B and H27B form molecular dimers and such dimers are held together by C-H...O interactions involving atom H34, forming molecular

### Figure 1

The molecular structure of (I), showing 50% probability displacement ellipsoids. Dotted lines indicate  $C-H\cdots O$  and  $C-H\cdots \pi$  interactions. H atoms have been omitted unless they are involved in hydrogen bonding.

#### Figure 2

Packing of molecules in (I). Dotted lines indicate  $C-H \cdots O$ ,  $C-H \cdots \pi$ and  $C-H \cdots Cl$  interactions. H atoms have been omitted unless they are involved in hydrogen bonding. [Symmetry codes: (\_1) x + 1, y, z - 1; (\_2a) -x + 1, -y + 2, -z; (\_2b)-x, -y+1, -z+1.]

chains along the *b* axis; Cg1 and Cg2 in Table 2 are the centroids of the indole rings N1/C1/C2/C8/C7 and N2/C24/C25/C31/C30, respectively. In addition, intermolecular C-H···Cl interactions (Table 2) involving atom H14 (molecule A) and the chlorine atom Cl2 (molecule B) further hold the molecules together, forming chains along the *c* axis, leading to the formation of a sheet-like structure (Fig. 2).

## Experimental

Compound (I) was synthesized according to the procedure reported in the literature (Nagarajan et al., 1985). Crystals were obtained from a solution of dichloromethane and hexane (1:2) by slow evaporation at 278 K.

Crystal data  $C_{23}H_{22}CINO$   $M_r = 363.87$ Triclinic,  $P\overline{1}$ . a = 9.7761 (14) Å b = 13.0082 (19) Å c = 15.832 (2) Å  $\alpha = 75.900$  (3)<sup>6</sup>  $\beta = 87.872$  (3)<sup>7</sup>  $\gamma = 81.639$  (3)<sup>5</sup> V = 1931.9 (5) Å<sup>3</sup>
